

Boost legal infra development for AI adoption in India: Study

OUR BUREAU

New Delhi, June 15

India should encourage research and innovation in establishing a legal infrastructure on the application of Artificial Intelligence (AI), says an Assocham-PwC study report titled 'Leveraging artificial intelligence and robotics for sustainable growth.'

The report highlighted the areas of application for AI techniques in large-scale public endeavours such as Make in India, Skill India and other crop insurance schemes, tax fraud schemes, detecting subsidy leakage and defence and security strategy.

"The Make in India initiative focussing on twin goals of strengthening the country's in-house innovation and production capabilities with added creation of employment opportunities may not end up creating as many jobs as it is poised to at this point in time," the report said.

Also, information technology (IT), manufacturing, agriculture and forestry are certain sectors that are expected to experience shrinkage of employment demand as robotic systems and machine learning algorithms take up several tasks, it noted.
